

Hands-On #3

Enhancing the Email List Application

In this hands-on session we shall be building and enhancing the Email List application.

1. Using VS Code open the file “index.html” and the “email_list.js” files from '03\email_list folder and complete the TODO tasks.

HINT: Refer to the PPTs for code snippets

2. Test the application to see how it works and review the codes
3. In the JavaScript file comment out the for loop that determines whether a state code entry is valid. Replace this with a for-in loop that gets the same result.

Test the changes made. If necessary fix the code and test again.

4. Use the push method of the states array to add “TX” for Texas to the array. We can code that statement right after the declaration for the array

Then test to see whether the lookup works for that state code
